BLSD 24 35 WDC – 2Q – T

BLDC speed driver-----

Rated voltage (VDC)-----

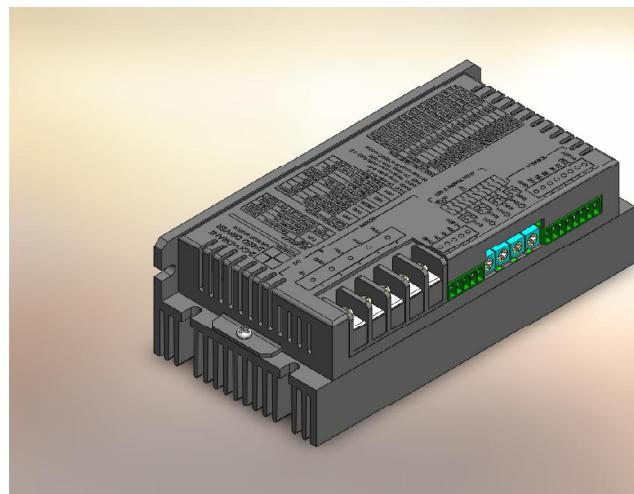

T=-40~+85 °C, None=-10~+50 °C

Peak current limit (A)-----

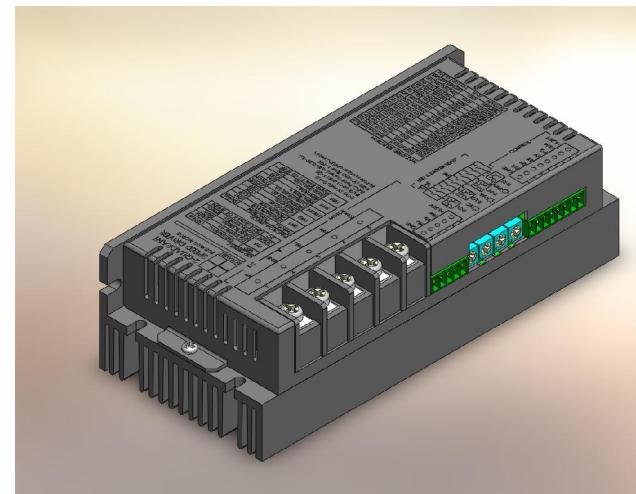

DC=Normal DC input, LDC=Ultra low voltage DC input, WDC=Wide range DC input-----

2-quadrant control mode -

35A/50A

75A/100A

Note:

1. Control signals:

F/R----H or Open=Forward, L or Close=Reverse
 EN----H or Open=Disable, L or Close=Enable
 BK----H or Open=Running, L or Close=Brake
 SV----0~5V speed reference (112K input resistance)
 PG----Speed pulse output (OC)
 ALM---Alarm output (OC)

2. Hall sensors cable can not be tied together with windings cable.

3. Alarm conditions:
 a. Hall sensor signals are not correct.
 b. LV or OV for 2~3S.

c. Short circuit and Over temperature of case.
 d. Over load for 6s continuously.
 e. It can be reset by Turn-Off-On DC Power or Disable the driver once.

4. LED indicator:

SC-----Bright=Short circuit , Dark=driver is OK
 P/A-----Bright=Driver is OK, Blink=Driver is in alarm
 SHAFT---Bright=Motor shaft is moving, Dark=Motor shaft is static

5. Braking operation:

The motor speed must be less than the safe brake speed Ns when you brake the motor.

For Y windings, $N_s = \sqrt{3} \times I_p \times R_L \times N / (2 \times V_p)$

For Δ windings, $N_s = I_p \times R_L \times N / (2 \times \sqrt{3} \times V_p)$

I_p =Peak current (A) , R_L =Line to line resistance of windings (Ohm) ,

N =No-load speed (rpm) , V_p =Rated voltage (V) , N_s =Safe brake speed (rpm)

6. Safe F/R:

If you change F/R of the driver rapidly, it will stop the power stage and motor will be free until the speed is detected as zero, and then to drive in correct direction. This means smooth reverse.

7. Safe start:

If the motor speed is not detected as zero at power on, the driver will be free until the motor speed is zero.

8. Driver setup by pot and switch:

R-SV pot=SV voltage ratio, R-LG pot=Loop gain, R-PC=Peak current ratio, R-RT pot=Ramp time

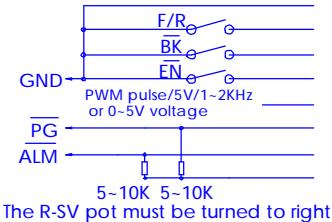

SW1=60°/120° Hall sensors, SW2=Open/Close loop, SW3,4=Speed/Current loop, SW5=Loop filter time, SW6=SV ramp time setting

SW7,8,9,10=Speed range setting

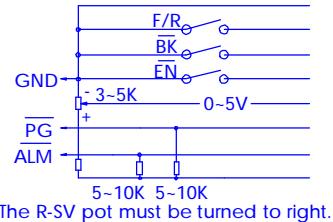

9. Peak current selection:

$I_p >= 2xI_r$ or $I_p >= 4xP_o/V_p$, I_p is peak current of driver (A) , I_r is rated current of motor (A) ,

P_o is rated output power of motor (W) , V_p is rated voltage of driver (V) .

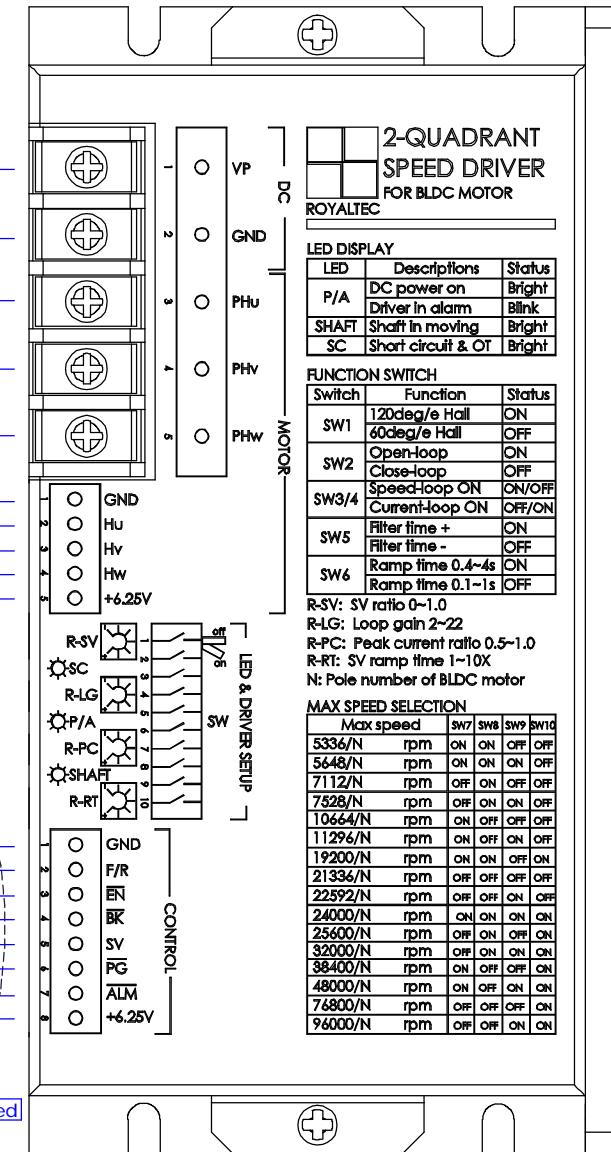

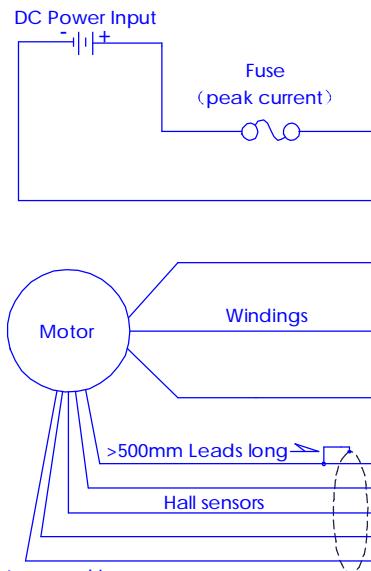

Use PWM pulse or SV voltage to control speed

Use additional pot to control speed

Typical Connection

Use R-SV pot to control speed
